(a) the bias formula holds
λ < 0.5
λ ≥ 0.5
identity
r = 0.950 at λ ≥ 0.5
observed $\hat{\beta}_1 - \beta_1^{\text{gold}}$ ($\times 10^{-3}$)
predicted bias $M^{-1}(0, -b\,\text{Cov}(X, \varepsilon^2))^\top$ ($\times 10^{-3}$)
(b) and it decides correctly
